1 Scope

This document provides the Test Suite Structure and Test Purposes for Basic Safety Message structure, content, and transmission as defined in SAE J2945/1 [1].

The ISO standard for the methodology of conformance testing (ISO/IEC 9646-1 [3] and ISO/IEC 9646-2 [4]) as well as the ETSI rules for conformance testing (ETS 300 406 [5]) are used as a basis for the test methodology.

V2V Vehicle-to-Vehicle
V2X Vehicle-to-Device

WAAS Wide Area Augmentation System

WAVE Wireless Access in Vehicular Environments

WGS World Geodetic System

4 Prerequisites and Test Configurations

4.1 Test Configurations

This clause introduces the test configurations that are used for the definition of test purposes. The test configurations cover the various scenarios of the J2945/1 tests for BSM conformance. Distance between the IUT and DSRC Packet Capture Tool shall not exceed five meters. In all test configurations antenna locations are located at an unspecified measured location and the test system is configured to account for the location. More information about the requirements for the DSRC Packet Capture Tool can be found in the DSRC Packet Capture Tool section of the Appendix.

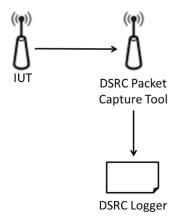

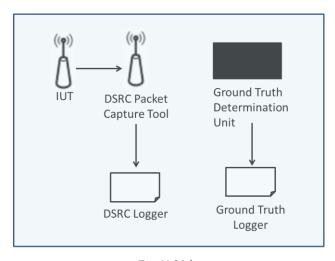

Figure 1: Test Configuration 1 (TC1)

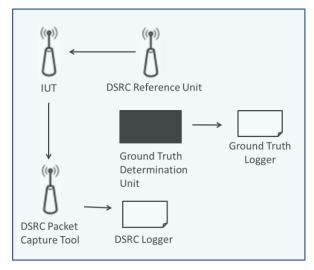

TC2 is used for moving vehicle tests, related to event conditions and data accuracy. Both the IUT and DSRC Packet Capture Tool are mounted inside of the test vehicle. Note that while TC2 explicitly requires the IUT to be mounted on a test platform, tests which are designed for TC1 can also be run on TC2. More information about the requirements for the Ground Truth device can be found in the Ground Truth Determination Unit section of the Appendix. More information about the requirements for the DSRC Packet Capture Tool can be found in the DSRC Packet Capture Tool section of the Appendix.

Test Vehicle

Figure 2: Test Configuration 2 (TC2)

TC3 is required for situations in which the IUT responds to BSMs sent from remote vehicles or tests that require exact measurements of the IUT. The IUT, DSRC Reference Unit, Ground Truth Determination Unit, and DSRC Packet Capture Tool are mounted in the test vehicle. More information about the requirements for the Ground Truth Determination Unit can be found in the Ground Truth Determination Unit section of the Appendix. More information about the requirements for the DSRC Packet Capture Tool can be found in the DSRC Packet Capture Tool section of the Appendix.

Test Vehicle

Figure 3: Test Configuration 3 (TC3)

TC4 is used for situations in which the test operator requires direct access to information located on the IUT.

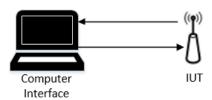

Figure 4: Test Configuration 4 (TC4)

TC5 is used for situations in which the test operator requires direct access to an SCMS device. For example, certificate revocation. The SCMS interactions are handled by an SCMS Emulator that implements the same interface as the production SCMS.

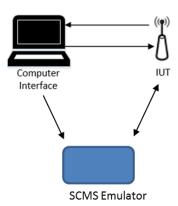

Figure 5: Test Configuration 5 (TC5)

4.2 Feature Restriction and Pre-Enrolment

4.2.1 Feature Restriction

In this clause all feature restrictions are listed:

- No external DSRC units within range of IUT, DSRC Packet Capture Tool, and DSRC Reference Unit are transmitting outside of the test setup.
- WAAS corrections are present for all devices.
- Signature and certificate content is assumed to be tested and validated through 1609.2 test method.
- Any reference to VehicleEventFlags only accounts for the Critical Event Flags: Hard Braking, ABS, Traction Control, and Stability Control. Testing is not required for any other VehicleEventFlags. All possible combinations of Critical Event Flags are organized in Section 7.6 of the Appendix.

States in Initial Conditions

Each TP contains a pre-test condition. The pre-test condition defines the initial state in which the IUT has to be to apply the actual TP. Most of the TPs start from the "initial state" which is defined as follows:

- The IUT is powered up
- GNSS in open-sky conditions[1] is being received.
- Unless otherwise stated, the IUT is not transmitting
- Unless otherwise stated, Congestion Control is enabled
- Unless otherwise stated, the IUT has the certificates available to successfully transmit BSMs for the
 duration of the test.

Some TPs start from a different initial condition which is explicitly defined in the TP. However, the "initial state" defined above is the starting point before the different initial conditions are established.

When the execution of the pre-test condition does not succeed, it leads to the assignment of an Inconclusive verdict.

4.3 Variants, Variables and Snippet Naming Convention

The TPs use the concept of variants. Their definition, how they are used and their naming conventions are defined in this clause.

Variants: In cases where for a single field multiple values can be tested, then a table is appended after the TP. This table lists all the different values which need to be tested. The TP identifier is appended with –X (e.g. **TP/SEC/ITS-S/ENR/NB-02-X**). If there are two fields for which multiple values can be tested then X and Y are appended. The field itself is written as X_FIELD_NAME (e.g. **X_PKT_SIGNATURE**).

Vendor Tests: In cases where requirements cannot be tested through black-box field tests (for example, hardware security or internal clock representation) these tests require hardware vendors to report on and confirm the functionality of the IUT. The TP identifier is appended with –V.

5 Test Suite Structure (TSS)

5.1 Structure for Content and Accuracy Tests

Table 1 shows the Test Suite Structure (TSS) including its subgroups defined for conformance testing.

Table 1: TSS for BSM

Root	Group	category
BSM	Stationary Vehicle	Valid
BSM	Moving Vehicle	Valid
BSM	Local Data	Valid
BSM	Local Data	Invalid

The test suite is structured as a tree with the root defined as BSM. The tree is of rank 2 with the first rank a group and the second a category. The third rank is the standard ISO conformance test categories.

5.2 Test Groups

The test suite has a total of three levels. The first level is the root. The second level separates the root based on the IUT's operating condition. The third level is the standard ISO conformance test categories.

5.2.1 Root

The root identifies the on-board system requirements for V2V Safety Communications given in SAE J2945/1 [1].

5.2.2 Groups

This level contains three message types identified as:

Stationary Vehicle: The vehicle used in the test does not move during the test Moving Vehicle: The vehicle is required to move at any time during the test

Local Data: The test contains requirements that cannot be tested through BSM transmission and require either grey box testing or a vendor's assurance that the IUT implements the the required aspect of the IUT

5.2.3 Categories

This level contains the standard ISO conformance test categories limited to the behavior valid event and behavior invalid event.

6 Test Purposes (TP)

6.1 Introduction

6.1.1 TP Definition Conventions

The TP definition is built according to EG 202 798 [i.1].

The TPs are defined by the rules shown in table 2.

Table 2: TP definition rules

TP ID	The TP ID is a unique identifier. It shall be specified according to the TP naming conventions defined in the clause below.	
Test Objective	Short description of test purpose objective according to the requirements from the base standard.	
References	The reference indicates the sub-clauses of the reference standard specifications in which the conformance requirement is expressed.	
Test Configuration	References the test configuration selected for this TP	
Pre-test conditions	Define the initial state the IUT has to be in to apply the actual TP. In the corresponding Test Case, when the execution of the initial condition does not succeed, it leads to the assignment of an Inconclusive verdict.	
Test Sequence	Definition of the events, which are parts of the TP objective, and the IUT are expected to perform in order to conform to the base specification. In the corresponding Test Case, Pass or Fail verdicts can be assigned there.	
	Event Types	
Stimulus	Corresponds to an event that forces an IUT to proceed with a specific protocol action	
Check	Ensures the conditions are appropriate to move to the next step in the test procedure, e.g. the receipt of protocol messages on reference points (i.e. output of the test system) with valid content, typically before the IUT stimulus is triggered. These events are not associated with the verdict evaluation (i.e. Pass/Fail)	
Configure	Performs some internal modification of the IUT that places it in a specific behavior state	
Verify	Consists of verifying that the IUT behaves according to the expected behavior (for instance the IUT behavior shows that it receives the expected message). Outcome of this event typically evaluate for verdict (i.e. Pass/Fail)	
Procedure	Procedural action directing the flow of TP execution.	

6.1.2 TP Identifier Naming Conventions

The identifier of the TP is built according to table 2.

Table 3: TP naming convention

Identifier	TP- <root>-<gr>-<x>-<nn></nn></x></gr></root>		
	<root> = root</root>	BSM	
	<gr> = group</gr>	SV	Stationary Vehicle
		MV	Moving Vehicle
		LD	Local Data
	$\langle x \rangle$ = type of testing	BV	Valid Behaviour tests
		BI	Invalid Syntax or Behaviour Tests
	<nn> = sequential number</nn>		01 to 99

6.1.3 Rules for the Behavior Description

The description of the TP is built according to EG 202 798 [i.1].

The base standards are not using finite state machine concept. As consequence, the test purposes use a generic "Initial State" that corresponds to a state where the IUT is ready for starting the test execution.

Being in the "Initial State" refers to the starting point of the initial device configuration. There are no pending actions, instantiated buffers, or variables which could disturb the execution of a test.

6.1.4 Sources of TP Definitions

All TPs are specified according to SAE J2735 [2] and SAE J2945/1 [1].

3	Configure	The computer interface is configured to execute a packet test		
4	Stimulus	The computer interface sends test packets to the IUT and tracks the amount of successfully sent packets		
5	Verify	At the end of the test, at least 90% of the packets were received with no error	Pass / Fail	
6	Verify	The DSRC Radio Subsystem complies with the standard (dot11ACRType = 1) adjacent and non-adjacent channel rejection requirements for 6 Mbps (QPSK with ½ rate coding), as specified in 802.11. The minimum input levels are measured at the antenna connector of the System housing.	Pass / Fail	

7 Appendix

7.1 Determining Randomness of Value Sets

For the purposes of testing the randomness of the values in the context of DSRC certification, a limited battery of tests will be run against a representative sample of values generated by the IUT.

$$SS = \frac{\left(Z^2 * (p) * (1-p)\right)}{c^2}$$

SS = sample size

Z = confidence level

p = a priori judgement (0.5 represents the worst case, unknown a priori)

c = confidence interval

Assuming no a priori judgement on the randomness of the dataset, **a p of 0.5 is used.** Substituting values for a 95% confidence with an interval of 5%, **a sample size of 385 is necessary to achieve a statistically significant result.**

In order to determine pass/fail, both the average and standard deviation of the data set will be used.

Take the average of the data over the sample set and determine whether the average is within an acceptable tolerance of the medium of the range. For this test document, the tolerance is .019 of the medium of the range. In the representation of the values, all values are considered unsigned.

Take the standard deviation of the values and determine if the sample's standard deviation is within a given tolerance. For this test document, the tolerance is .066 of the maximum of the range divided by the square root of 12. In the representation of the values, all values are considered unsigned.

7.2 Ground Truth Determination Unit

Identifier	TP-GT- <x>-<nnn></nnn></x>		
	<x> = type of procedure</x>	GTDU	Ground Truth Determination Unit
		MOVECOL	Moving Data Collection
	<nnn> = sequential numbering</nnn>		001 - 999

Requirement #	Requirement
TP-GT-MOVECOL-001	The Ground Truth Determination Unit shall contain an interface to a standard 12v auto power plug, or sufficient battery to power in capture mode for a minimum of four hours.
TP-GT-MOVECOL-002	The Ground Truth Determination Unit shall have an interface to the vehicle CAN bus, capable of determining the current steering angle. Steering position data must be recorded at the frequency it is given.
TP-GT-MOVECOL-003	The Ground Truth Determination Unit shall provide a UTC timestamp to all individual and fused sensor data, such that timestamps match those of incoming BSMs.
TP-GT-MOVECOL-004	The Ground Truth Determination Unit shall be mounted such that it does not affect the performance of the IUT, e.g., through obstruction of open sky view of the GNSS.
TP-GT-MOVECOL-005	The Ground Truth Determination Unit shall be capable of providing 3 dimensional acceleration data within the range ±2g, with accuracy better than ±0.01g.
TP-GT -MOVECOL-006	The Moving Vehicle Data Collection Tool shall be capable of providing yaw rate data within the range ±300 deg/s, with accuracy better than ±.05 deg/s.
TP-GT -MOVECOL-007	The Ground Truth Determination Unit shall provide a fused localization estimate at a rate of at least 100 Hz.
TP-GT -MOVECOL-008	The fused localization from the Ground Truth Determination Unit shall provide, at a minimum, longitudinal acceleration, lateral acceleration, latitude, longitude, altitude, heading, and rate of heading change (yaw rate).

TP-GT -MOVECOL-009	The Ground Truth Determination Unit shall provide indication of its current compliance with accuracy requirements.
TP-GT -MOVECOL-010	The Ground Truth Determination Unit shall provide an interface to begin data recording.
TP-GT -MOVECOL-011	The Ground Truth Determination Unit shall provide an interface to monitor data recording.
TP-GT -MOVECOL-012	The Ground Truth Determination Unit shall provide an interface to end data recording.
TP-GT -MOVECOL-013	The Ground Truth Determination Unit shall provide an interface for moving data to data repository.
TP-GT -MOVECOL-014	The Ground Truth Determination Unit shall provide an interface for configuring transformations from actual position to vehicle center.
TP-GT -MOVECOL-015	The Ground Truth Determination Unit shall save recorded data, including at a minimum GPS, Accelerometer, Gyro, steering encoder, and fused localization readings, in a form which can be interpreted by the Moving Vehicle Data Analysis Tool.
TP-GT -MOVECOL-016	The Ground Truth Determination Unit shall provide an interface to confirm successful collection of data.
TP-GT -MOVECOL-017	The Ground Truth Determination Unit shall save recorded data in a common format which can be interpreted by the manufacturer of the IUT.
TP-GT-GTDU-005	The Ground Truth Determination Unit shall be capable of providing an HDOP value.
TP-GT-GTDU-006	The Ground Truth Determination Unit shall require an absolute accuracy of 10 cm per 2 sigma.

7.3 DSRC Packet Capture Tool

Identifier	TT-REF- <nnn></nnn>	
<nnn> = sequential numbering</nnn>		001 - 999

Requirement #	Requirement
TT-PACKCAP-001	The DSRC Packet Capture Tool shall contain an interface to a standard 12 V auto power plug, or sufficient battery to power in capture mode for a minimum of four hours.
TT-PACKCAP-002	The DSRC Packet Capture Tool shall store data such that the packet and moving vehicle analysis tools can trivially differentiate between data received from the IUT, DSRC Reference Unit, and DSRC radios not within the test setup.
TT-PACKCAP-003	The DSRC Packet Capture Tool shall capture all DSRC packets originating from the IUT or DSRC Reference Unit on channel 172.

TT-PACKCAP-004	The DSRC Packet Capture Tool shall timestamp all recorded packets with corresponding received UTC time.
TT-PACKCAP-005	The DSRC Packet Capture Tool shall provide an interface for viewing the current DE_temporaryID in use by the IUT.
TT-PACKCAP-006	The DSRC Packet Capture Tool shall save captured data in a format which can be interpreted by the manufacturer of the IUT.

7.6 Critical Event Flag Variant Table

	Critical Event Flag Variants		
X	Event Flag	Bit Location	
1	ABS Activated	2	
2	Traction Control Loss	3	
3	Stability Control Activated	4	
4	Hard Braking	7	
5	ABS Activated,	2,	
	Traction Control Loss	3	
6	ABS Activated,	2,	
	Stability Control Activated	4	
7	ABS Activated,	2,	
	Hard Braking	7	
8	Traction Control Loss,	3,	
	Stability Control Activated	4	
9	Traction Control Loss,	3,	
	Hard Braking	7	
10	Stability Control Activated,	4,	
	Hard Braking	7	
11	ABS Activated,	2,	
	Traction Control Loss,	3,	
	Stability Control Activated	4	
12	ABS Activated,	2,	
	Traction Control Loss,	3,	
	Hard Braking	7	
13	ABS Activated,	2,	
	Stability Control Activated,	4,	

	Hard Braking	7
14	Traction Control Loss,	3,
	Stability Control Activated,	4,
	Hard Braking	7
15	ABS Activated,	2,
	Traction Control Loss,	3,
	Stability Control Activated,	4,
	Hard Braking	7

Revision History

V0.1.0	Aug 2015	Initial Draft
V0.2.0	Jan 2016	Updated to agreed upon format and Draft 5 of the J2945/1 standard
V0.3.0	Feb 2016	Updated based on comments received from USDOT and walkthrough
V0.4.0	April 2016	Updated based on comments received from industry review
